Director, Site Reliability Engineering

Vertafore | 14 June 2026

Dear Hiring Manager,

Standing up an SRE function in a new GCC is a well-defined challenge: baseline SLOs, build the observability stack, hire and structure the team, establish on-call and incident processes, and get CI/CD and IaC practices running at product pace. I have done this more than once, and I can execute it without a learning curve.

At ADP, I built the SRE programme from zero inside a GCC model: defined SLOs and error budgets across a multi-tenant financial platform, deployed full-stack observability (Prometheus, Grafana, Dynatrace, Splunk), stood up 24x7 on-call rotations and escalation frameworks for a team that grew from 4 to 40 engineers across India, Canada, and the US, and embedded blameless postmortem culture that cut MTTR by 40%+ in the first year. I ran the same build at Charles Schwab in parallel -- 18-member Platform Engineering team from the ground up. Alongside both, I owned CI/CD delivery handling 200+ builds per hour with feature flag-driven release controls and Terraform/AWS CDK-backed IaC. The first 12 months at Vertafore Hyderabad look familiar. That is the point.

Two credentials worth flagging: iSRE (Certified SRE) and Prometheus Certified Associate (PCA, 2026) -- Prometheus is the backbone of the observability stack I run day-to-day. I would welcome a short conversation to confirm alignment on scope and compensation before we go further.

Yours sincerely,

Pavan Kumar Nayakanti
